

ABSTRACT

An Online Library Management System is a software application developed to automate and manage the activities of a library efficiently. The system helps in maintaining records of books, students, and issued or returned books in a systematic manner. It allows librarians to add, update, search, and delete book records easily. Students can view available books, issue requests, and return details through the system. The project reduces manual work, saves time, and improves accuracy in managing library operations. It also provides secure access through login authentication for administrators and users. The system can generate reports related to issued books, due dates, and library transactions. The main objective of this project is to simplify library management processes and provide a user-friendly digital platform for both students and library staff. This system enhances efficiency, reduces paperwork, and ensures proper management of library resources in educational institutions.
